

MOHAMED BENISSA

Software Engineer

trax.taz710@gmail.com | +31687761110

SUMMARY

Software Engineer with experience in AI/LLM-enabled systems, backend platforms, API systems, dashboards, and scalable application workflows. Strong focus on backend architecture, secure API design, asynchronous processing, message queues, database design, and system reliability. Experienced with Java Spring Boot, Python FastAPI, Django, PostgreSQL, RabbitMQ, REST APIs, React, Vue, Docker, and CI/CD practices.

FEATURED PROJECT

AI-Powered Incident Automation Platform

Python, FastAPI, RabbitMQ, PostgreSQL, SQLAlchemy, Ollama, Docker

- Built an AI-powered backend automation platform that processes technical log files and transforms them into structured incident analysis reports.
- Designed an asynchronous event-driven architecture using a REST API, message broker, background worker, local AI service, and persistent storage layer.
- Implemented a queue-based processing workflow where uploaded incidents are stored, dispatched to background workers, analyzed by a locally hosted LLM, and saved as structured results.
- Integrated local AI through Ollama to support incident triage without relying on paid cloud APIs or exposing log data externally.
- Developed AI-assisted analysis for severity classification, root-cause estimation, affected-service detection, recommended engineering actions, confidence scoring, and model tracking.
- Added lifecycle tracking and failure handling across queued, processing, completed, and failed states to improve visibility and debugging of background jobs.
- Demonstrated production-style backend concepts including asynchronous workers, message queues, local AI automation, structured outputs, database persistence, and API-driven processing.

EXPERIENCE

Software Engineer, API Platform - Logichainge

Feb 2026 - Present
Venlo, Netherlands

- Built an API platform from scratch across **5 core areas**: backend services, frontend dashboard, API key management, request logging, and developer documentation.
- Designed secure backend APIs for authentication, authorization, organization-based access control, standardized responses, request validation, and restricted data access.
- Implemented API key lifecycle management covering key creation, active key management, revocation, expiration handling, and access validation.
- Created a frontend API dashboard for usage visibility, request activity, performance indicators, logs, and key status monitoring.
- Added logging and monitoring flows to track API requests, failed authentication attempts, revoked-key access, and rate-limit behavior.
- Performed performance and load testing across **20+ test scenarios**, including concurrent requests, rate-limit behavior, burst limits, and error-response validation.
- Contributed to architectural decisions around API platform scalability, maintainability, modular design, and future subscription-based access control.

Junior Software Engineer - Logichainge

Sep 2024 - Sep 2025
Venlo, Netherlands

- Designed and implemented a comprehensive analytics dashboard visualizing order statistics, AI accuracy, processing time, validation time, and operational performance.
- Resolved multiple technical issues and implemented email domain whitelisting and blacklisting, strengthening system reliability and security.
- Developed scalable application features, improving system performance by **30%** and supporting smoother handling of increasing workloads.
- Utilized modern frameworks and tools, improving development efficiency by **20%** through cleaner architecture, optimized workflows, and maintainable code.
- Collaborated within an agile team across sprint planning, implementation, testing, debugging, deployment, and documentation.
- Participated in peer code reviews, improving code quality, maintainability, and shared technical knowledge across the team.

Software Engineer, Freelance

May 2024 - Aug 2024
Eindhoven, Netherlands

- Developed a full-stack e-commerce web application from scratch, allowing vendors to list products, manage orders, and access detailed sales analytics.

- Built backend services using Java Spring Boot, designing RESTful APIs for product listings, order handling, vendor management, and analytics.
- Developed a responsive frontend using React and TypeScript, ensuring a smooth user experience for vendors and customers.
- Configured domain and hosting on DigitalOcean, including SSL setup, deployment automation, and server monitoring.
- Implemented scalable application architecture, optimized database design, and established CI/CD practices for maintainability and future platform growth.

EDUCATION

Fontys University

2022 - 2026

TECHNICAL SKILLS

Backend: Java Spring Boot, Python FastAPI, Django, REST APIs, SQLAlchemy, API gateway concepts

Frontend: React, TypeScript, Vue.js, HTML, CSS

Databases: PostgreSQL, MySQL, MongoDB

Messaging & Async: RabbitMQ, background workers, producer-consumer workflows, job lifecycle tracking

AI Integration: Ollama, local LLMs, structured AI output, AI-assisted automation

DevOps & Tools: Docker, Docker Compose, Git, CI/CD, DigitalOcean, Postman, Swagger/OpenAPI

Quality: Load testing, API testing, debugging, logging, monitoring, code reviews
